Evidence before promotion

PolicyWatcher records configured public policy sources and explains changes for human review. This release makes extraction experiments inspectable.

Source release

Adaptive Acquisition Evidence

Baseline retained

Optional shadow observation

An explicit source allowlist and per-scan budget bound comparisons with up to three candidate recipes. No extra fetch per candidate.

Frozen-input replay

Reproducible candidate evidence

Private captures and immutable receipts support replay. Train/holdout and independent-label gates keep unsupported lessons non-operational.

Read-only diagnostics

Source Reliability workbench

Inspect saved observations, separate baseline and observer errors, exclusions and comparisons. Missing evidence is distinct from zero.

Explicit source scope

Locale and regional drift checks

Explicit URL-variant drift is rejected. Live, partial and historical evidence remain distinct; URL hints are not legal jurisdiction.

Shadow is disabled by default and requires private operator configuration. No automatic recipe promotion, model training or calibrated confidence is claimed. This sheet is not an accuracy benchmark, legal opinion or production-activation receipt.
